

# Safety Relay for Elevators SR3E

## Operating Instructions

English translation

Errors and technical changes reserved

### Correct Use

SR3E is an all-purpose emergency stop device with three safe relay contacts for safe monitoring of one or two channel sensors.

The SR3E is specially designed for the use as safety component in elevators according to EN 81-20 and EN 81-50, certified by TÜV Rheinland.

Further applications for the SR3E include single or dual-channel emergency stop circuits and guard monitoring on machines and plants according to EN ISO 13849-1, EN 62061 and EN 61508.

- 3 non-delayed safety contacts
- 1 non-delayed auxiliary contact
- Connection of:
  - Emergency stop buttons
  - Mechanical Safety switches
  - Non-contact safety switches
  - Safety components with OSSD-Outputs
- Control: single or dual channel
- Feedback loop for external contactors or extension modules
- Cyclic monitoring of the output contacts
- LED indicator for power and status
- Automatic or manual start
- Short-circuit monitoring and ground fault monitoring
- Up to PL e, SILCL 3, category 4  
(EN ISO 13849-1 / EN 62061 / EN 61508)

ID 0600000000

### Function

The safety relay SR3E is designed for isolation of safety circuits according to EN 60204-1, stop-category 0 and can be used in safety-related applications up to safety category 4, PL e (EN ISO 13849-1) SILCL 3 (EN 62061 / EN 61508) and as a safety component in elevators according EN 81-20.

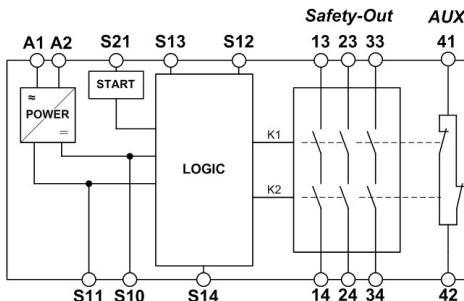

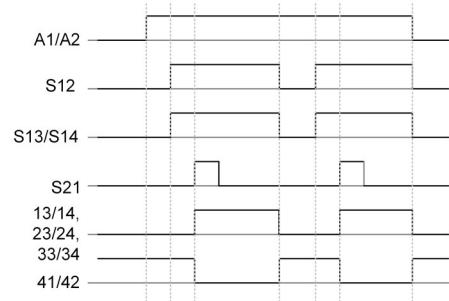

Fig. 1 Block diagram SR3E

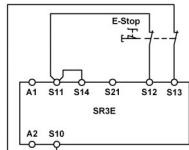

# Safety Relay for Elevators SR3E

## Operating Instructions

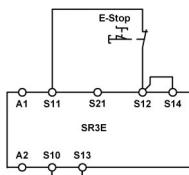

### Applications

Depending on the application or the result of the risk assessment according to EN ISO 13849-1, the device must be wired as shown in Fig. 5 to Fig. 16.

#### Emergency Stop Circuit

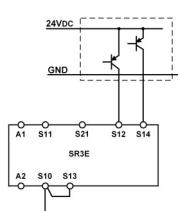

**Fig. 5:**  
Dual channel emergency stop with short circuit and ground fault monitoring.  
(category 4, up to PL e / SIL 3)

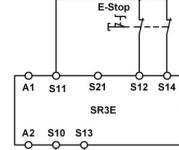

**Fig. 6:**  
Dual channel emergency stop with ground fault monitoring.  
(category 3, up to PL d / SIL 2)

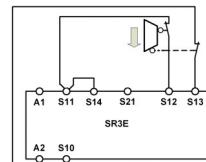

**Note:**  
For applications according EN 81-20 a fault exclusion for short circuit between S12 and S14 is required

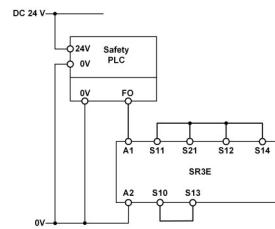

**Fig. 7:**  
Single channel emergency stop with ground fault monitoring.  
(category 1, up to PL c / SIL 1)  
**Note:**  
Not suitable for applications in elevators according to EN 81-20

**Fig. 8:**  
Dual channel safety guard monitoring with short circuit and ground fault monitoring.  
(category 4, up to PL e / SIL 3)

**Fig. 9:**  
Two channel emergency stop with pnp-outputs/OSSD-outputs with its own short circuit monitoring.  
(category 4, up to PL e / SIL 3)  
**Prerequisite:**  
Signal generator meet requirements for PL e / SIL 3, too.

**Fig. 10:**  
Connecting to a safety PLC  
(category 4, up to PL e / SIL 3)  
**Prerequisite:**  
Safe PLC output meets the required safety level and short circuit between PLC output and SR3E can be excluded  
(e.g. wiring inside an electrical installation space - see EN ISO 13849-2; Tab D4).

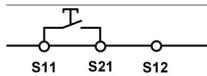

### ATTENTION: Loss of functional safety!

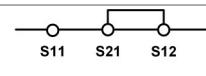

For the applications according Fig. 9 and Fig. 10 the following is to be noted:

- Make sure that the ground potential of the signal generator and the SR3E is the same
- It must be ensured that any switch-on pulses (light test) sent by the signal generator do not lead to a short activation of the safety relay and should therefore basically be deactivated.

### Start Behaviour

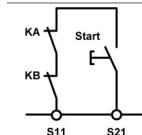

**Fig. 11:**  
Monitored manual start.  
It is monitored that the start button has been opened before the safety switch is closed.  
**Prerequisite:**  
Power supply may not be interrupted

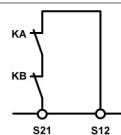

**Fig. 12:**  
Automatic start.  
Maximum allowable delay when closing the safety switches at S12 and S13/S14:  
S12 before S13/S14: 200ms  
S13/S14 before S12: no limit

### Feedback Loop

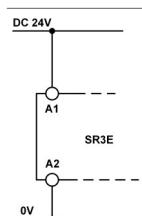

**Fig. 13:**  
Feedback loop for monitored manual start.  
The feedback loop monitors contactors or the expansion modules .

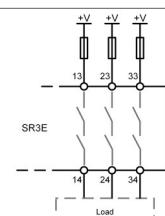

**Fig. 14:**  
Feedback loop for automatic start.  
The feedback loop monitors contactors or the expansion modules .

### Power supply and Safety contacts

**Fig. 15:**  
Power supply A1 and A2.

**Fig. 16:**  
Connecting load to safety contacts. Voltage „+V“ according to techn. Data.

### Commissioning Procedure

**Advice:** Follow the guidelines in „Electrical Connection“ during the start-up.

#### 1. Input circuit:

Depending on the risk evaluation choose one of the wiring diagrams in „Applications“ (Fig. 5 to Fig. 10).

#### 2. Choose start mode:

Connect the start button with S11 and S21 for monitored manual start or connect S21 with S12 directly for automatic start (Fig. 11 or Fig. 12).

#### Warning:

If “Automatic start” is set, bear in mind that the safety contacts will switch immediately after the power supply is connected. If “Monitored manual start” is set, the start button must be opened after wiring.

#### 3. Feedback loop:

If external contactors or extension modules are used, connect them according to Fig. 13 or Fig. 14.

#### 4. Power supply:

Connect the power supply to A1 and A2 (Fig. 13).

**Caution:** Power must not yet be activated.

#### 5. Starting the device:

Switch on the operating voltage.

#### Warning:

If the “Automatic start” starting behaviour is set, the safety contacts will close immediately.

If the “Monitored manual start” starting behaviour is set, close the start button to close the safety contacts.

LEDs Pwr, K1 and K2 are lit.

#### 6. Triggering safety function:

Open the emergency stop circuit by actuating the connected safety switch. The safety contacts open immediately.

#### 7. Reactivation:

Close the emergency stop circuit. If “Automatic start” is selected, the safety contacts will close immediately.

If the “Monitored manual start” starting behaviour is set, close the start button to close the safety contacts.

### Check and Maintenance

No maintenance is required for the device itself. But the following checks are regularly required to ensure proper and continuous functioning:

- Check the switch function
- Check for signs of manipulation and safety function bypassing

- Check if the device is mounted and connected securely
  - Check for soiling
- Check if the safety device is working properly, in particular:
- Every time after initial commissioning
  - Every time after replacing a component
  - After every fault in the safety circuit

According to CNB / M / 11.050, a request for the safety function is recommended at the following intervals:

- Once a month for applications up to PL e with Cat. 3 or Cat. 4 or SIL CL3, SIL 3 with HFT = 1
- Once a year for applications up to PL d with Cat. 3 or SIL CL 2, SIL 2 with HFT = 1

### What to do in Case of a Fault?

#### Device does not switch on:

- Check the wiring by comparing it to the wiring diagrams.
- Check the safety switch for correct function and adjustment.
- Check whether the emergency stop circuit is closed.
- Check whether the start button (manual start) is closed.
- Check the operating voltage at A1 and A2.
- Is the feedback loop closed?

#### Device cannot be switched on after an emergency stop:

- Emergency stop circuit was closed again.
  - Was the start button opened before closing of the emergency stop circuit (manual start)?
  - Is the feedback loop closed?
- If the fault still exists, perform the steps listed under "Commissioning Procedure". If these steps do not remedy the fault either, return the device to the manufacturer.

### Safety Characteristics according to EN ISO 13849-1
